

# NLP project on MU3D

## Introduction

This NLP project focus on the same data set MU3D, which has a column fracture called "Transcription". The Transcription contains the Full transcription of the video, which is a text record of the video for each volunteer. My goal in this NLP part is to calculate the text TF-IDF, which is Term Frequency-Inverse Document Frequency, to define the importance of a keyword or phrase within a document. TF- IDF is the product of two statistics, term frequency and inverse document frequency. where the equations are:

$$TF : \quad tf(t, d) = \frac{f_{(t,d)}}{\sum_{t' \in d} f_{t',d}}$$

$$IDF : \quad idf(t, D) = \log \frac{N}{|\{d \in D : t \in d\}|}$$

$$TF - IDF : \quad tfidf(t, d, D) = tf(t, d) \cdot idf(t, D)$$

To interpret the value of TF-IDF, the higher the TF-IDF score the more important or relevant the term is; as a term gets less relevant, its TF-IDF score will approach 0.

Next, I will import the dataset and calculate the TF-IDF and interpret it step by step.

## Justisfication

As the above result shows the words, for example, “and”, “I”, “you” “to”, “a”, “the”, etc, has a value of zero TF-IDF, which means those words are the least important in the transcription. In the later work, I can remove those words to avoid expensive computational time and increase the accuracy of machine learning classification.
